

HomeoOpinion

AI-Powered Homoeopathic Second Opinion Portal
Enriched Product Requirements Document

Version	2.0
Date	May 2026
Status	Draft
Classification	Confidential

1. Executive Summary

HomeoOpinion is a digital health portal designed to democratise access to qualified homoeopathic second opinions. The platform connects patients who are seeking alternative or supplementary medical perspectives with BHMS/MD(Hom.) registered practitioners across India and globally. Patients upload lab reports, describe symptoms and medical history using structured homoeopathic intake forms, and receive an AI-generated preliminary case analysis. Licensed homoeopathic doctors then review the AI report, add their expert commentary, and offer follow-up consultations (online or in-clinic). An administrative layer handles doctor onboarding, case routing, compliance, and analytics.

The portal is purpose-built for homoeopathy, incorporating domain-specific concepts such as constitutional case-taking, miasmatic assessment, modality capture, mental-emotional symptom profiling, and repertorization support — none of which exist in generic telemedicine platforms.

2. Market Context and Opportunity

India has over 2,24,000 registered homoeopathic doctors, 195 undergraduate and 43 postgraduate colleges, and more than 7,800 government dispensaries offering homoeopathic services. Despite this vast infrastructure, patients in tier-2 and tier-3 cities often struggle to access specialist homoeopathic opinion, particularly in branches like psychiatry, paediatrics, and constitutional prescribing.

The global medical second opinion market is experiencing rapid growth, with approximately 38% of patients now using virtual consultations for second opinions. AI-powered diagnostic support is improving clinical precision by up to 20%, and 20% of clinicians already consult large language models for supplementary opinions. The Indian government’s Telemedicine Practice Guidelines (2020) explicitly cover Registered Homoeopathic Practitioners (RHPs), providing a clear regulatory framework. This convergence of digital health adoption, regulatory clarity, and an underserved patient population creates a strong opportunity for a homoeopathy-focused second opinion portal.

3. Platform Architecture Overview

3.1 System Roles

Role	Description	Authentication
Patient (User)	Seeks homoeopathic second opinion by uploading reports,	Google OAuth 2.0, optional email/phone OTP

	describing symptoms, and optionally booking consultations	
Doctor	Licensed BHMS/MD(Hom.) practitioner who reviews cases, adds expert analysis, and conducts consultations	Credential-based login or Google OAuth with admin-verified registration
Admin	Platform operator who onboards doctors, manages case routing, monitors dashboards, and enforces compliance	Credential-based login with MFA

3.2 High-Level Flow

1. Patient registers/logs in and creates a new case
2. Patient fills structured homoeopathic intake form and uploads lab reports/documents
3. AI engine generates a preliminary case analysis report (symptom extraction, possible rubrics, constitutional indicators)
4. Case is routed to qualified doctors based on speciality tags and filters
5. Doctor reviews the AI report plus uploaded documents, adds expert comments and recommendations
6. Patient receives notification that the report is ready (WhatsApp/email/SMS)
7. Patient reviews the report; if deeper consultation is desired, patient pays and books an appointment
8. Doctor conducts consultation (video/audio/in-clinic), prescribes remedy, and documents follow-up plan
9. Patient can return for follow-up appointments with the same doctor on the same case

4. User (Patient) Module

4.1 Registration and Authentication

- Primary login via Google OAuth 2.0 for frictionless onboarding
- Optional email or mobile OTP-based login for users without Google accounts
- Profile creation: name, age, gender, city, preferred language (English, Hindi, regional)
- Terms of service and informed consent for telemedicine (as per CCH Telemedicine Practice Guidelines 2020)
- Optional: link Aadhaar or ABHA (Ayushman Bharat Health Account) for future ABDM integration

4.2 Homoeopathy-Specific Case Intake Form

Unlike generic medical platforms, HomeoOpinion captures data essential for homoeopathic case analysis. The intake form is structured across the following sections:

4.2.1 Chief Complaint and History

- Free-text description of current problem (what, when, how it started)
- Duration and progression of symptoms
- Any previous allopathic/homoeopathic/ayurvedic treatment taken and its effects
- Family medical history (hereditary tendencies — relevant for miasmatic assessment)
- Past significant illnesses, surgeries, vaccinations

4.2.2 Constitutional and Mental-Emotional Profile

This section captures the holistic picture that homoeopathic case-taking requires, going beyond just physical symptoms:

- Temperament and disposition (anxious, irritable, weepy, reserved, sociable, etc.)
- Fears and phobias (darkness, being alone, heights, disease, death, thunder, etc.)
- Sleep patterns: position, dreams (recurring themes), quality, disturbances
- Emotional triggers and coping style
- Response to consolation, sympathy, contradiction
- Food cravings and aversions (salt, sweet, sour, spicy, eggs, meat, milk, etc.)
- Thermal preference: chilly or warm-blooded patient
- Thirst pattern: quantity, frequency, temperature preference
- Perspiration: location, timing, odour

4.2.3 Modalities (Aggravating and Ameliorating Factors)

- Time modalities: symptoms worse/better morning, evening, night, specific hours
- Weather modalities: effect of heat, cold, humidity, storm, season change
- Position modalities: sitting, standing, lying down, specific side
- Activity: rest vs. motion, before/during/after exertion
- Other: eating, pressure, touch, bathing, clothing

4.2.4 Speciality Tags and Routing

Users select one or more speciality tags to route their case to appropriately qualified doctors. The tag taxonomy is aligned with MD(Hom.) specialisations recognised by the Central Council of Homoeopathy:

Clinical Speciality	Academic Alignment	Example Conditions
General / Constitutional	Organon & Philosophy	Chronic constitutional cases, miasmatic treatment
Skin & Dermatology	Practice of Medicine	Eczema, psoriasis, urticaria, warts, acne
Paediatrics	MD Paediatrics	Childhood asthma, behavioural issues, ADHD, growth concerns
Mental Health / Psychiatry	MD Psychiatry	Anxiety, depression, OCD, insomnia, phobias
Women's Health / Gynaecology	Practice of Medicine	PCOS, menstrual disorders, menopause, infertility support
Respiratory	Practice of Medicine	Allergic rhinitis, asthma, recurrent sinusitis, bronchitis
Gastroenterology	Practice of Medicine	IBS, acid reflux, chronic constipation, liver disorders
Musculoskeletal / Rheumatology	Practice of Medicine	Arthritis, spondylitis, sciatica, fibromyalgia
Autoimmune Disorders	Practice of Medicine	Thyroid disorders, lupus, vitiligo
Oncology Support	Practice of Medicine	Supportive/palliative care alongside conventional treatment

4.2.5 Document and Report Upload

- Supported formats: PDF, JPEG, PNG, DICOM (for radiology images)
- File size limit: 25 MB per file, 100 MB total per case
- Document types: blood reports (CBC, LFT, KFT, thyroid panel, lipid profile, etc.), imaging reports (X-ray, MRI, USG), previous prescriptions, discharge summaries
- AI-powered OCR for extracting structured data from scanned lab reports
- Drag-and-drop upload with preview and annotation capabilities
- Document tagging: users can label each upload (e.g., "Blood Test – March 2026", "Previous Homoeopathic Prescription")

4.3 AI-Generated Preliminary Report

The AI engine processes the intake form and uploaded documents to generate a preliminary analysis. This is explicitly positioned as a decision-support tool, not a diagnosis, in compliance with regulatory guidelines:

1. Symptom Extraction and Structuring: Converts free-text narrative into structured symptom categories (mental, general, particular) following Kent's hierarchy
2. Lab Report Parsing: Extracts key biomarkers, flags abnormal values, and presents them alongside homoeopathic relevance notes
3. Rubric Suggestions: Maps reported symptoms to potential repertory rubrics (using standard rubric language from Kent's Repertory)
4. Constitutional Indicators: Based on the mental-emotional profile, food preferences, thermal state, and modalities, suggests possible constitutional types for the doctor's consideration
5. Miasmatic Tendency: Based on family history and symptom patterns, indicates possible predominant miasm (Psora, Sycosis, Syphilis, Tubercular)
6. Red Flag Alerts: Identifies symptoms requiring urgent conventional medical attention, ensuring patient safety

Disclaimer prominently displayed: "This AI-generated report is a preliminary analysis tool to assist qualified homoeopathic practitioners. It is not a diagnosis or prescription. All clinical decisions rest with the reviewing doctor."

4.4 Notification and Waiting

- After submission, the user sees an estimated time for report readiness (configurable by admin; default: 24–48 hours)
- Push notification channels: WhatsApp (via Business API), email, SMS, in-app notification
- Status tracking: Submitted → Under AI Processing → Awaiting Doctor Review → Report Ready → Consultation Booked
- User can check real-time status on their dashboard

4.5 Viewing Report and Booking Consultation

- Report is presented in a clean, readable format with sections for AI analysis and doctor's expert comments
- User reviews the report at no charge (or at a nominal platform fee — configurable)
- If the user wants a live consultation, they proceed to payment and appointment booking
- Payment gateway integration: Razorpay/PayU/Stripe with UPI, credit/debit card, net banking, wallet support
- Appointment types: video call (via integrated WebRTC or Jitsi), audio call, or in-clinic visit (if doctor offers offline consultations)
- Slot selection from the doctor's available calendar
- Consultation fees displayed upfront (set by doctor, optionally with platform commission)

4.6 Follow-Up and Case Continuity

- Patient can return and book follow-up appointments on the same case with the same doctor
- Complete case history is maintained: all reports, doctor comments, prescriptions, and consultation notes are chronologically threaded
- Doctor can request updated lab reports or symptom updates before follow-up
- Follow-up pricing can differ from initial consultation (configurable by doctor)
- Prescription history with remedy name, potency, dosage, and repetition schedule

5. Doctor Module

5.1 Registration and Onboarding

- Login via credentials (email + password) or Google OAuth
- Registration requires admin verification before account activation
- Required onboarding documents: BHMS degree certificate, MD(Hom.) certificate (if applicable), CCH/State Board registration number, valid ID proof, passport-size photograph
- Admin verifies registration number against the National Register of Homoeopaths (NRH) maintained by CCH
- Doctor signs a platform agreement covering code of conduct, fee structure, and data privacy obligations

5.2 Doctor Profile and Speciality Configuration

Each doctor's profile serves as both a public-facing credential page and an internal routing filter:

Profile Field	Details
Qualifications	BHMS, MD(Hom.) with specialisation branch, any additional certifications
Speciality Tags	Multiple selectable from the same taxonomy used in patient intake (skin, psychiatry, paediatrics, etc.)
Prescribing Approach	Classical/Unicist, Pluralist, Complex, Organ-specific (for patient transparency)
Experience	Years of practice, notable case areas, institutional affiliations
Languages	Languages spoken for consultation

Consultation Modes	Online (video/audio), offline (clinic address with map pin), or both
Availability Calendar	Weekly slot configuration with buffer time between appointments
Consultation Fees	Initial consultation fee, follow-up fee (set by doctor)
Ratings and Reviews	Aggregated patient ratings post-consultation

5.3 Case Dashboard and Review Workflow

1. Doctor sees a filtered queue of incoming cases matching their speciality tags
2. Each case card shows: patient demographics (anonymised until accepted), chief complaint summary, speciality tags, AI confidence score, submission timestamp
3. Doctor can preview the AI-generated report and uploaded documents before accepting the case
4. Upon accepting, the doctor gets full access to the patient's case file
5. Doctor studies the case, cross-references with materia medica knowledge, and adds structured comments: agreement/disagreement with AI suggestions, additional rubrics identified, recommended remedies (with potency and rationale), suggested investigations or lifestyle modifications, red flag observations
6. Doctor dispatches the completed report back to the patient
7. Case status updates to "Report Ready" and patient is notified

5.4 Consultation Management

- Accept/decline appointment requests based on availability
- Video consultation powered by WebRTC/Jitsi with screen sharing for reviewing reports together
- Consultation notes template with homoeopathic fields: remedy prescribed, potency, dosage schedule, expected aggravation period, dietary restrictions, follow-up timeline
- E-prescription generation compliant with CCH telemedicine guidelines
- Digital prescription includes: patient name, age, date, remedy name in standard nomenclature, potency, dose, frequency, duration, doctor's registration number and digital signature

5.5 Patient Search and Case History

- Search patients by name, case ID, date range, speciality, or case status
- View complete longitudinal case history for returning patients
- Add ongoing notes to a patient's case file across multiple consultations
- Track treatment progress: symptom evolution timeline showing which symptoms improved, appeared, or intensified after each prescription

5.6 Earnings and Payouts

- Earnings credited upon completion of each consultation (not at booking — protects patients)
 - Transparent earnings dashboard: per-consultation earnings, platform commission deducted, net payout
 - Payout schedule: weekly or bi-weekly bank transfer via NEFT/IMPS
 - GST invoice generation for doctors (as applicable under Indian tax law)
 - Refund handling: if consultation does not occur due to doctor no-show, payment is fully refunded to patient
-

6. Admin Module

6.1 Doctor Lifecycle Management

1. Onboarding: review submitted credentials, verify against NRH/State Board records, approve or reject with reason
2. Active monitoring: track each doctor's response time, case acceptance rate, patient ratings, and complaint history
3. Off-boarding: suspend or permanently remove doctors with documented reasons; handle pending cases and patient communication

6.2 Case Visibility and Routing Controls

- Admin can control which doctors see which cases (e.g., restrict sensitive cases, route to senior practitioners)
- Auto-routing rules engine: match case speciality tags to doctor speciality tags with configurable weighting
- Manual override: admin can reassign a case to a specific doctor
- Escalation workflow: if no doctor accepts a case within the SLA window, admin is alerted to intervene

6.3 Analytics Dashboard

The admin dashboard provides real-time and historical views across the following metrics:

Metric Category	Key Indicators
-----------------	----------------

Case Volume	Total cases submitted, cases by speciality, cases by geography, daily/weekly/monthly trends
Resolution	Cases reviewed by doctors, average review time, cases pending, cases escalated
Consultation	Total consultations booked, completed, cancelled, no-shows; online vs. offline split
Financial	Total revenue, platform commission earned, doctor payouts, refunds processed
User Engagement	Active users, returning users, drop-off rates at each funnel stage, NPS scores
Doctor Performance	Avg. response time, acceptance rate, patient ratings, cases per doctor
AI Performance	AI report accuracy (based on doctor agreement rate), rubric suggestion relevance, red flag detection rate

6.4 User and Doctor Management

- Block/suspend users for abuse, fake reports, or terms violation; with email notification and appeal process
- Block/suspend doctors for misconduct, consistently poor reviews, credential issues; with formal notice
- Bulk communication: send announcements, policy updates, or feature notifications to all users or doctors
- Content moderation: flag and review inappropriate comments or uploads

7. AI Engine Specifications

The AI layer is the core differentiator of HomeoOpinion. It is purpose-trained for homoeopathic contexts, not a generic medical AI:

7.1 Capabilities

1. Lab Report OCR and Parser: Extract structured data from scanned blood/imaging reports using computer vision and NLP. Handle Indian lab formats (Thyrocare, SRL, Dr Lal PathLabs, etc.).
2. Symptom-to-Rubric Mapping: Map patient-described symptoms to standard homoeopathic repertory rubrics. Support Kent's Repertory rubric language as the baseline, with extensibility for Synthesis and Complete Repertory.

3. Constitutional Profiling: Based on mental, general, and particular symptoms, suggest possible constitutional remedy groups for the doctor's consideration.
4. Miasmatic Analysis: Analyse family history patterns and current symptom characteristics to suggest predominant miasmatic tendency (Psora, Sycosis, Syphilis, Tubercular).
5. Red Flag Detection: Identify emergency or serious symptoms (chest pain, neurological deficits, suspected malignancies) that require urgent conventional medical attention, regardless of the homoeopathic context.
6. Multi-lingual Support: Process intake forms in English, Hindi, and major regional languages; output reports in the user's preferred language.

7.2 Guardrails and Compliance

- AI output is always labelled as “preliminary analysis” and “for practitioner review only”
 - AI never prescribes remedies or potencies directly to patients
 - Confidence scores accompany every AI suggestion, allowing doctors to gauge reliability
 - All AI outputs are logged and auditable for quality assurance and model improvement
 - Model bias monitoring: regular evaluation to ensure balanced performance across demographics
-

8. Regulatory and Compliance Framework

8.1 Indian Regulations

- CCH Telemedicine Practice Guidelines (2020) for Registered Homoeopathic Practitioners: Governs all teleconsultation activity on the platform
- Information Technology Act 2000 and IT Rules 2011: Data protection and intermediary liability
- Digital Personal Data Protection Act 2023 (DPDPA): Consent management, data minimisation, purpose limitation, breach notification
- Drugs and Cosmetics Act 1940: E-prescription compliance for homoeopathic medicines
- Clinical Establishments Act 2010: If applicable to partner clinics offering offline consultations
- ABDM (Ayushman Bharat Digital Mission) standards: Future integration with national health ID ecosystem

8.2 Data Protection Measures

- All patient health information (PHI) encrypted at rest (AES-256) and in transit (TLS 1.3)
- Role-based access control (RBAC): doctors see only cases assigned to them
- Audit trails for all data access, modifications, and exports

- Data residency: all primary data stored within India
- Right to erasure: patients can request deletion of their data
- Anonymisation for analytics and AI training datasets
- Regular third-party security audits and penetration testing

9. Suggested Technical Architecture

Layer	Technology Options
Frontend (Web)	React.js / Next.js with Tailwind CSS; responsive PWA for mobile-first experience
Frontend (Mobile)	React Native or Flutter for cross-platform iOS/Android apps
Backend API	Node.js (Express/NestJS) or Python (FastAPI/Django REST Framework)
Database	PostgreSQL (primary), Redis (caching and session), MongoDB (document/report storage)
AI/ML Pipeline	Python (LangChain/LlamaIndex for LLM orchestration), fine-tuned models for homoeopathic NLP, OCR (Tesseract/Google Vision API)
Video Consultation	Jitsi Meet (self-hosted, open source) or Twilio Video API
File Storage	AWS S3 / GCP Cloud Storage with server-side encryption
Notifications	WhatsApp Business API (Gupshup/Twilio), Firebase Cloud Messaging, SendGrid (email), MSG91 (SMS)
Payment Gateway	Razorpay / PayU with UPI, cards, net banking, wallets
Authentication	Firebase Auth / Auth0 with Google OAuth, JWT tokens
Hosting	AWS (Mumbai region) / GCP (asia-south1) for data residency compliance
CI/CD	GitHub Actions / GitLab CI with Docker containers, Kubernetes orchestration
Monitoring	Grafana + Prometheus (infrastructure), Sentry (error tracking), Mixpanel (product analytics)

10. Non-Functional Requirements

Attribute	Requirement
Performance	Page load < 2s; API response < 500ms (p95); AI report generation < 5 minutes
Scalability	Handle 10,000 concurrent users at launch, horizontally scalable to 100K+
Availability	99.9% uptime SLA; multi-AZ deployment; automated failover
Accessibility	WCAG 2.1 AA compliance; multi-language UI; voice input support for intake forms
Security	OWASP Top 10 compliance; annual VAPT; encrypted PHI; MFA for admin/doctor roles
Disaster Recovery	RPO < 1 hour; RTO < 4 hours; daily automated backups with cross-region replication
Audit	Complete audit log for all PHI access; tamper-proof log storage; 7-year retention

11. Phased Delivery Roadmap

Phase 1: MVP (Months 1–4)

- Patient registration (Google OAuth) and basic case intake form
- Document upload with basic AI report generation (symptom extraction + lab parsing)
- Doctor onboarding (admin-verified) and case review workflow
- WhatsApp/email notifications
- Payment integration and basic video consultation
- Admin dashboard with core metrics

Phase 2: Enhanced AI and Engagement (Months 5–8)

- Full homoeopathic intake form (constitutional, mental-emotional, modalities)
- Rubric suggestion engine and miasmatic analysis in AI reports
- Doctor mobile app (React Native/Flutter)
- Follow-up appointment and case continuity features
- E-prescription generation
- Multi-language support (Hindi + 2 regional languages)

Phase 3: Scale and Ecosystem (Months 9–12)

- Advanced AI: constitutional profiling, red flag detection, treatment progress tracking
- ABDM/ABHA integration for national health ID linkage
- Patient mobile app with appointment reminders and remedy tracking
- Doctor rating and review system
- API marketplace for integration with homoeopathic pharmacy delivery services
- Community features: anonymised case studies for doctor learning circles

12. Risk Matrix

Risk	Likelihood	Impact	Mitigation
Doctor adoption too slow	Medium	High	Early engagement with homoeopathic associations (IHO, LIGA); seed with respected practitioners
AI report inaccuracy	Medium	High	Mandatory doctor review before patient sees report; continuous feedback loop for model improvement
Regulatory ambiguity	Low	High	Legal counsel specialised in AYUSH regulation; design for CCH guideline compliance from day one
Data breach	Low	Critical	Encryption, RBAC, regular security audits, cyber insurance, incident response plan
Patient misuse of AI report	Medium	Medium	Clear disclaimers; AI never prescribes directly; report gated behind doctor review
Payment disputes	Medium	Low	Clear refund policy; escrow-style payment release only after consultation completion

13. Success Metrics (First 12 Months)

Metric	Target
Registered patients	10,000+
Onboarded doctors	200+ verified BHMS/MD(Hom.)

Cases submitted	5,000+
Doctor report turnaround	< 48 hours (avg.)
Consultations completed	2,000+
Patient satisfaction (NPS)	> 50
Repeat consultation rate	> 30%
AI report doctor agreement	> 70% rubric relevance

End of Document — HomeoOpinion Product Requirements Document v2.0
